## Prospective customers

The company Haans Autoschades BV in Tilburg, Holland, uses a Logitrans stacker with platform for lifting up trolleys containing plastic components to an attic for temporary storage. This solution is much cheaper than the installation of a lift. At the same time the stacker can solve other transport jobs inside the company.

In addition to the low price, the company also appreciates the traditional Logitrans advantages:

- High manoeuvrability
- Compact dimensions
- Low maintenance costs
- Good safety
- Efficient design

The above situation is a good example of small companies getting benefits by using Logitrans products. There are many companies like the above, typically with a little space and many different application situations. This requires a large flexibility in our range of products.

### Important arguments for using stackers:

- Saving on space.
- No wasted waiting time for transport.
- The employees can carry out most transport jobs themselves.
- Make the daily work of the employees much easier.
- The time savings recover the investment quickly.

### Important arguments for using Logitrans stackers:

- Assisted steering on both wheels.
- Release lever in the handle.
- Can be delivered with different sizes of platforms.
- Available with straddle legs for all pallet types.
- Standard with quick-shift attachment for forks/platform.
- Simple and easy to operate and maintain.
- Possible to adjust according to customer requirements.

**Other products** for the same customer group: Pallet trucks, highlifters, Logilifts, trucks with weighing system and Logitilts.
